

World Class SystemVerilog & UVM Training

## **Sunburst Design - SystemVerilog UVM Verification Training**

by Recognized Verilog & SystemVerilog Guru, Cliff Cummings of Sunburst Design, Inc.

*Cliff Cummings is the only Verilog & SystemVerilog Trainer who helped develop every IEEE & Accellera Verilog, Verilog Synthesis and SystemVerilog Standard.*

**6 Half-Days**

**3+ Hours Daily Lecture / Up to 2 Hours Daily Lab-Time**

**Beginning – Advanced (No prior UVM experience required)**

***All EDA Vendors agree that UVM is the unified future of SystemVerilog Verification***

### Course Objective

Complete up to 13 Labs, including 10 full self-checking UVM testbenches. *For engineers to become proficient at UVM verification, they need experience coding multiple full, self-checking UVM testbenches.* To accomplish this goal, engineers will use the Sunburst Design `uvmtb_` template files to rapidly develop block-level UVM testbenches.

*The #1 priority in this course is to have engineers complete and understand as many full UVM self-checking testbenches as time permits.*

As part of the course objective, training will make verification engineers knowledgeable, proficient and productive at UVM verification, using training materials and UVM template files developed by renowned Verilog, SystemVerilog & UVM Guru, Cliff Cummings.

Upon completion of this course, students will understand and use:

- SystemVerilog-verification language features
  - includes SystemVerilog classes & methods
  - includes SystemVerilog virtual classes & virtual methods
  - includes SystemVerilog interfaces and virtual interfaces
  - includes SystemVerilog constrained random testing
- UVM-verification language capabilities
  - includes UVM fundamentals and running/stopping tests
  - includes UVM correct messaging
  - includes UVM transactions and sequences
  - includes UVM testbench components and their usage
  - includes UVM scoreboard with predictor, comparator & reporting
  - includes UVM template files for rapid UVM testbench development

Questions about course content and customization, email Cliff Cummings: [cliffc@sunburst-design.com](mailto:cliffc@sunburst-design.com)

Questions about pricing, quotes, scheduling, email Michael Hoyt: [michael.hoyt@paradigm-works.com](mailto:michael.hoyt@paradigm-works.com)

## Course Overview

*Sunburst Design - SystemVerilog UVM Verification Training* is a 6-half-day, fast-paced intensive course that focuses on advanced verification using UVM.

### Why is UVM hard to learn?

Many engineers believe they can learn UVM by picking up and reading a book and the UVM User Guide. They quickly discover this is exceptionally difficult to do. To learn why it is so hard to learn UVM from existing materials, see the Appendix notes at the end of this syllabus.

Good UVM training should address each of the issues that make UVM materials difficult to understand (as described in the Appendix notes).

### Target Audience

*Sunburst Design - SystemVerilog UVM Verification Training* is intended for design & verification engineers who require UVM verification methodology training.

### Prerequisites (mandatory)

***This is a very advanced SystemVerilog verification class that assumes engineers already have a good working knowledge of both Verilog and SystemVerilog.*** Engineers with no prior HDL training or experience will struggle in this class.

### Online Training Details

Training will be conducted using the Paradigm Works WebEx account.

All materials will be provided as color, searchable, protected PDF files with a 3-year license, and are accessible on laptops running Windows 7 and above. When enrolling, students need to share their email address and the country where they are located for Paradigm Works to generate the licensed electronic materials.

Students should have access to their own login and simulation license. The labs will be available for download to work during class. Students will keep a copy of their labs at the end of class.

For students who do not have access to their own simulation license, Paradigm Works has a limited number of training logins that can be accessed by students using VNC during this training class. Any VNC viewer should work. Cliff uses TigerVNC and students only need to download and install the TigerVNC Viewer App.

### Course Customization?

To schedule dedicated training for your company, Sunburst Design courses can be customized to include ***your*** company's coding guidelines or to modify the course for a different audience. Sections can be added or deleted from a course to meet you company's needs.

# COURSE SYLLABUS

## Half-Day One

### **1. SystemVerilog Enhancements & Methodology Overview**

- Includes a quick review of SystemVerilog resources available to design & verification engineers.

- UVM resources
- UVM introduction
- UVM conflicting recommendations - why?

#### **(1) Classes & Class Variables**

Section Objective: Learn class basics - UVM is a class library used to construct powerful verification environments. Class fundamentals are described in this section.

- SystemVerilog class basics
- Traditional Object Oriented (OO) programming -vs- SystemVerilog Classes
- Class definition & declaration
- Class members (data) & methods (tasks & functions)
- Class handles & using class handles
- Built-in class object constructor - new()
- super & this keywords
- Assigning object handles
- User-defined constructors
- Class extension & inheritance
- Class extension - adding properties & methods
- Class extension - overriding base class methods
- Assigning class handles
- Assigning extended handles to base handles
- Casting base handles to extended handles (technique used by UVM)
- Chaining new() constructors - illegal new() constructors
- Overriding class methods
- Extending class methods
- Extern methods
- Static methods
- local & protected keywords

## **2. UVM Overview First Pass & uvmtb template files**

Section Objective: Learn fundamentals of UVM testbench development and execution. This section briefly introduces important UVM fundamentals followed by a lab to help students with first-pass familiarity and introduction to UVM testbench development. Students will not fully understand all of the section concepts while creating the first UVM testbench, but it is important that students do the lab to build a foundation for later learning. Each of the concepts in this section will be taught a second time with greater detail in later sections. Engineers will learn more quickly after they have experienced the lab techniques at least once before exploring advanced UVM concepts. This section also introduces the uvmtb\_template files for rapid UVM testbench development.

- UVM transactions (data)
- Components (testbench components)
- Display command
- Top module DUT, interface, interface wrapper
- Testbench classes: environment, sequencer, driver, monitor, virtual interface
- Test classes
- Running tests using +UVM\_TESTNAME command line switch
- Stopping tests using raised & dropped objections
- uvmtb\_template files
- The 8 template files that require modification for simple block-level verification
- LAB - UVM Common Errors
- LAB - UVM First Testbench - Testing a Counter (*Full UVM self-checking testbench #1*)

## Half-Day Two

### **3. Virtual Classes, Virtual Methods and Virtual Interfaces**

Section Objective: Learn fundamentals of virtual classes/methods/interfaces - Virtual classes enable the creation of a set of base classes that provide a template for advanced verification environments. UVM is a base class library made up of mostly virtual classes that the user extends to create a reusable testbench environment. Virtual methods allow run-time base-method replacement that is a vital part of the UVM strategy (polymorphism).

- Introduction to Virtual - three types of "virtual"
- Virtual/abstract classes
- Legal & illegal virtual class usage
- Virtual class methods & restrictions
- Virtual Methods and rules
- Virtual -vs- non-virtual method override rules
- Why use virtual methods?
- Polymorphism using virtual methods
- Pure virtual methods (SystemVerilog-2009 update - used by UVM)
- Interfaces and virtual interfaces for UVM testbench development
- Passing type parameters

### **4. Constrained Random Testing and Functional Coverage Part I**

Section Objective: Introduction to class variable randomization and setting randomization constraints - UVM uses classes and constrained random variables for the construction of constrained random testing environments. Introduction to functional coverage including covergroups and coverpoints. An introduction to constrained random testing and functional coverage are described in this section.

- Directed -vs- random testing
- rand & randc class variables
- randomize() method - Randomizing class variables
- pre\_randomize()/post\_randomize() methods
- randomize ... with
- rand\_mode()
- Randomization constraints
- Simple constraints
- Constraints blocks
- Important constraint rules
- Constraint distribution & set membership - dist & inside
- Constraint distribution operators
- External constraints & usage rules
- LAB - Random Variables & Randomization (*Full UVM self-checking testbenches #2-3*)
- LAB - Constrained Random Stimulus (*Full UVM self-checking testbench #4*)

## **5. UVM Base Classes & Reporting (UVM print/display commands)**

Section Objective: Learn about UVM base classes and basic display and reporting commands.

3-day class includes introduction to SystemVerilog dynamic & associative arrays.

- SystemVerilog dynamic arrays
- SystemVerilog associative arrays
- UVM Base Classes
- Introduction to UVM core base classes, `include files and macros
- Block diagram of DUT-testbench structure
- UVM verification components
- UVM components and objects
- UVM transactions (passing UVM data & methods - dynamic class objects)
- UVM factory basics
- Reporting methods & arguments
- Reporting macros and why they are preferred
- UVM\_VERBOSITY explained
- Why the UVM User Guide, Reference Manual and Books get VERBOSITY wrong!
- LAB - UVM Messaging

## Half-Day Three

### **6. UVM Transaction Base Classes, Sequences & Tests**

Section Objective: Learn to use and manipulate UVM transactions. This section shows why transactions are classes and not structs. This section also shows the two common techniques to define standard transaction methods, as well as the two common techniques to execute transactions and sequences, along with pros, cons and benchmarks of each method. This section then shows techniques to define and run sequences and tests.

- Why classes -vs- structs?
- Dynamic transaction classes
- `uvm\_object\_utils macro
- uvm\_sequence\_item -vs- uvm\_transaction
- Standard transaction methods
- do\_copy, do\_compare and other do\_methods
- Field macros
- Randomizable data members, knobs & constraints
- uvm\_object constructors
- UVM sequence body task
- start\_item(tx) - finish\_item(tx)
- `uvm\_do macros
- randomize() the transaction
- randomize() the transaction with inline constraints
- UVM sequences of uvm\_sequence\_item and uvm\_sequence
- Running UVM tests

### **7. Top Module, DUT & uvm\_resource\_db / uvm\_config\_db**

Section Objective: Learn how to connect a UVM class-based testbench to an actual Design Under Test (DUT) - This section explains the role that interfaces, virtual interfaces, configuration tables and the UVM resource database APIs play in a testbench environment.

- Top module
- DUT (Design Under Test)
- DUT Interface
- Connecting DUT to DUT interface
- DUT interface handle
- 90%+ of UVM verification engineers are using the wrong database API
- uvm\_resource\_db#(type) set/read\_by\_name API
- uvm\_config\_db#(type) set/get API
- Why uvm\_resource\_db API is easier and more powerful than uvm\_config\_db API
- Configuration tables
- set/get\_config\_object (old method to store the DUT interface handle)
- Virtual interfaces for verification
- LAB - UVM Agent (Sqr-Drv-Mon) (*Full UVM self-checking testbench #5*)

## Half-Day Four

### **8. UVM Testbench Agent – Sequencer / Driver / Monitor**

Section Objective: 3/4-day class includes introduction to SystemVerilog queues. Learn to use UVM environments, agents, sequencers, drivers, and monitors - Setting up the driver is a critical step. The class-based driver must drive the module-based DUT through a virtual interface that drives a real interface. UVM uses monitors to sample DUT signals through the virtual interface and captures the transaction that is then broadcast through an analysis port to a scoreboard and coverage collector.

- UVM components to build the testbench structure
- UVM testbench structure (quasi-static class objects)
- `uvm\_component\_utils macros
- uvm\_component constructors
- UVM components connected through ports & exports
- Testbench driver (get-port configuration)
- Managing the virtual interface - config table - required dynamic casting
- Testbench sequencer (get-export configuration)
- Testbench agent & environment
- User-defined testbench package
- UVM analysis ports
- Analysis port broadcast command
- UVM monitors with analysis ports
- UVM agents with analysis ports
- Active and passive agents
- uvm\_subscriber with analysis export
- Connecting a coverage collector using an analysis export
- LAB – FIFO Gray Code Pointer - (*Full UVM self-checking testbench #6*)

### **9. UVM Scoreboards - Part I**

Section Objective: The first scoreboard technique uses pre-coded scoreboard wrapper, predictor with extern calc-expected function, and pre-coded comparator with 2 uvm\_tlm\_analysis\_fifos. The first technique only requires completion of the extern sb\_calc\_expected function.

- SystemVerilog queues
- SystemVerilog mailboxes
- uvm\_tlm\_fifo
- uvm\_tlm\_analysis\_fifo
- What is the job of the scoreboard
- Scoreboard architecture #1
- Pre-coded scoreboard wrapper and predictor
- Extern sb\_calc\_exp function - requires user to complete this function
- Pre-coded comparator with 2 uvm\_tlm\_analysis\_fifos
- LAB – UVM Scoreboard Style #1 - Barrel Shifter - (*Full UVM testbench lab #7*)
- LAB – UVM Scoreboard Style #1 - Pipeline Design - (*Full UVM testbench lab #8*)

## Half-Day Five

### **10. UVM Scoreboards - Part II**

Section Objective: The second scoreboard technique is commonly shown in online examples and uses 2 `uvm_analysis_imp_ports` and 2 `uvm_tlm_fifos`, which requires the use of special macros. This section starts off with a tutorial about SystemVerilog queues & mailboxes, then describes the `uvm_tlm_fifos` and how they are used. Then the second scoreboard technique is described.

- Scoreboard architecture #2
- Multiple analysis implementation ports
- ``uvm_analysis_imp_decl` macros
- LAB – UVM Scoreboard Style #2 - 2 Analysis Imp Ports - (*Full UVM testbench lab #9*)

### **11. Fork-Join & Advanced UVM Sequence Generation**

Section Objective: Learn advanced sequence generation techniques - New fork-join capabilities were added to SystemVerilog and they are commonly used by advanced UVM sequence generation environments.

- New SystemVerilog fork-join processes
- UVM virtual sequences
- Virtual sequencers & virtual sequences requirements
- `m_sequencer`, `p_sequencer`, ``uvm_declare_p_sequencer`
- Virtual sequence base class details
- Common `test_base`
- Starting virtual sequences
- Multi-bus virtual sequencer example
- LAB - Virtual Sequencer & Sequences

### **12. Clocking Blocks and Verification Timing**

Section Objective: Learn important stimulus and verification timing issues and techniques - SystemVerilog clocking blocks help control timing for UVM verification environments.

- Testbench stimulus/verification vector timing strategies
- #1step sampling
- Clocking blocks
- Clocking skews
- Default clocking block cycles
- Clocking block scheduling
- UVM usage of clocking blocks in an interface
- UVM driver timing using clocking blocks
- UVM signal sampling using clocking blocks

## Half-Day Six

### **13. Transaction Level Modeling (TLM) Basics**

Section Objective: Transaction Level Modeling (TLM) is taught after it has been used the first two days of UVM training. This section shows how transactions are passed between classes through ports, exports, put-configurations, get-configurations and transport configurations.

- TLM ports & exports
- Why "ports" and "exports"
- TLM put, get and transport configurations
- Transaction-level control flow
- Transaction-level data flow
- Transaction-level transaction type
- Put configurations
- Get configurations
- Transport configurations

### **14. UVM Factory & Constructors**

Section Objective: Learn the basics of UVM factories, registration, class construction and introduce the concept of factory overrides. This section will show why factories are important to UVM testbenches and describe differences between new() -vs- type\_id::create() methods.

- UVM factory basics
- Why is a factory used in UVM
- new() -vs- type\_id::create() construction
- Component and data lookup from the factory
- Running without re-compilation
- Tests can make substitutions without changing the testbench source code
- Introduction to factory overrides

### **15. Constrained Random Testing and Functional Coverage Part II**

Section Objective: Learn functional coverage fundamentals - Functional coverage is used to track what has been tested. Functional coverage is used to help answer the question, "are we done testing?" This section includes cover statements & compares them to covergroup coverage.

- Code coverage -vs- functional coverage
- Covergroups & coverpoints
- Auto-bins & user-named bins
- User-named array of bins
- Cross coverage
- Covergroup.sample() method
- Transition bins
- Coverage options & coverage capabilities
- Comparing cover to covergroup coverage
- LAB – UVM Functional Coverage - (*Full UVM testbench lab #10*)

## APPENDIX - Why are OVM & UVM hard to learn?

Many engineers believe they can learn UVM by picking up and reading a book and the OVM or UVM User Guides. They quickly discover this is exceptionally difficult to do. Why is it so hard to learn UVM from existing materials?

Through years of experience, Sunburst Design has identified the following reasons why engineers struggle with existing UVM tutorial materials:

- 1) The UVM User Guide was written by Cadence and teaches Cadence recommended methods, which includes the use of a large number of UVM macros.
- 2) The UVM tutorials on VerificationAcademy.org are shown using Siemens / Mentor recommended methods, which includes the use of fewer UVM macros and more UVM method calls.
- 3) The OVM Cookbook was written by Mentor employees and is based on an earlier version of OVM (the latest techniques are not shown in the book).
- 4) The above User Guide, tutorials and Cookbook do not acknowledge or explain the alternate methods, so users are left to draw erroneous conclusions that some of the methods shown are flawed, which is not true. Learners need to be taught the pros and cons of the alternate methods so that they understand why there are differences in the various methods presented.
- 5) All the people who have written UVM materials are *really, really* smart software engineers who assume that engineers already understand SystemVerilog syntax and semantics, object oriented programming and polymorphism semantics, and they don't know how to teach these concepts to beginners.
- 6) Many of those who have written UVM materials are software engineers who do not have a strong grasp of good hardware design practices, and it shows in many of the examples.
- 7) The UVM User Guide (chapter 2) and the OVM Cookbook (chapter 3) introduce Transaction Level Modeling (TLM) concepts, including put, get and transport communication, but do a poor job of tying the concepts into the rest of the OVM/UVM materials. Engineers often wonder why TLM was introduced in these texts.
- 8) Most UVM materials show the driver on the right and the monitor on the left (right to left data-flow inside of the agent). This contradicts known good hardware block diagramming methods (data should flow from left to right in block diagrams) and adds an unnecessary level of confusion to the learning process for those who are familiar with good block diagramming techniques.
- 9) There is a huge shortage of complete simple examples. Most of the publicly available example code is in abbreviated code-snippet form, leaving the new user to guess what is missing. Finding full online examples is rare. One notable example shows OVM used on a large VHDL design, which introduces yet another unknown to the learning process.
- 10) Of course, you must understand classes, class-extension, virtual classes, virtual methods, dynamic casting, polymorphism, randomization, constraints, covergroups, coverpoints, interfaces and virtual interfaces before you can learn UVM. Too many engineers try to learn UVM without a full understanding of these SystemVerilog fundamentals (this is not the fault of UVM authors).
- 11) Classes are applied as stimulus and sampled for verification. Existing materials do not explain why classes are used instead of structs?
- 12) Interfaces, virtual interfaces and their recommended usage-models are somewhat buried in the materials and are poorly explained (most authors assume you understand these concepts without much explanation - they are wrong).
- 13) There are a significant number of typos and mistakes sprinkled throughout the materials and examples. The mistakes leave the learner to try to figure out which coding styles are correct and which have typos.

Sunburst Design UVM training addresses each of these issues.
